Download as MP3, mp3 (320 kbit/s) File Page (Full Screen) Play. Full Album by The Cranberries:Q. How to catch an SSLException in java? I'm writing some code that handles invalid SSL certificates. How can I catch an SSLException that is thrown when the certificate is invalid? The goal is to have the java application fail gracefully (e.g. gracefully exit, or give an informative error message, instead of just crashing). A: If the hostname part of the certificate is invalid, you will get an SSLException, with the host name in the "detail" field. The approach is to: Get the SSLException. Read the details field (if there is one). If the details field is an InetAddress object, then we have an untrusted certificate. If the details field is a String, then the certificate is OK. Since SSL/TLS is an application layer protocol, you have to do that at the application layer. If you are already handling certificates at that level, you can either write another handler for this specific exception, or you can write another method for checking validity of the certificate. (And then invoke the standard validation methods). The following example shows how to create a method that checks for "hostname mismatch", which is one of the possible values in the "detail" field. `import java.net.SocketException; import java.security.GeneralSecurityException; import java.security.cert.Certificate; import java.security.cert.CertificateEncodingException; import java.security.cert.CertificateException; import java.security.cert.X509Certificate; import javax.net.ssl.SSLContext; import javax.net.ssl.SSLSocket; import java`
